

React Project

Goal:

- This project must be implemented using the introduced technologies and concepts (React, Typescript, .Net Core, Entity Framework, LINQ, HTTP API)

Context:

Implement a single page web-application to manage (create, read, update, delete) the following entities and their relationships:

- Company
- Staff
- Tasks

The relationships between those entities have the following cardinalities:

- A staff member can work only for one company
- A company can have many staff members
- A staff member can perform many tasks
- A task can be performed by many staff members at the same time

In the user interface of the application a user must be able to view all the records of an entity or create one, then perform the appropriate actions (read, update, delete) on each record.
